"Oral Treatment of Pernicious Anemia"

Belgrade, Srpski Arhiv za Tselokupno Lekarstvo, Vol 94, No 6, 1966,
pp 535-540

Abstract: /Authors' English summary modified/ The article describes the cases of 12 patients suffering from pernicious anemia who were orally treated with vitamin B¹² and the intrinsic factor (Biofac). The diagnosis was confirmed by clinical, cytological, and biochemical methods, and the oral treatment was the first therapy employed. Total recovery was achieved in 11 out of 12 patients, this being similar to other recoveries obtained by parenteral use of vitamin B¹². The control examinations of the patients speak in favor of the preparations used. The remission of one patient which lasted already 19 months and the experiences obtained in Denmark with Biofac give hopes of the permanent effect of oral treatment of pernicious anemia. The patient who failed to recover even with the parenteral use of vitamin B¹² led to doubts of the existence of a true pernicious anemia. As the patient refused further examination, the proper diagnosis of the disease could not be established. There are 2 Yugoslav and 19 Western references. (Manuscript received, 18 Feb 66.)

Title : Pseudotuberculosis in Hares.

Orig Pub : Betrln. Glasnik, 1957, 11, No 6, 620-621

Abstract : Pseudotuberculosis in hares was investigated for the first time in Yugoslavia. At autopsy, diffuse cohesive peritonitis, as well as cysticercosis of the liver and pseudomonad-braneous tiftitis were revealed. Histological investigations also revealed colliculi of various sizes and ages in the mucosa of the intestines. The newly formed colliculi consisted mainly of epithelial cells, among which Langhans giant cells were found. In the peripheral sections of the colliculi infiltrations were observed consisting of lymphocytes and leukocytes mostly. In older colliculi a

considerable degree of calcification was found to be present; their center appeared transformed into a formless necrotic mass. The existing literature denies the presence of giant Langhans cells and of calcification foci in pseudotuberculosis of hares and rabbits. These assertions were nullified by the findings of the author.

AUTHOR: Stefanovich, A. Ye.
TITLE: The instability of an anisotropic plasma
PERIODICAL: Zhurnal tekhnicheskoy fiziki, v. 32, no. 5, 1962, 638 - 640
TEXT: It is shown that the instability of an anisotropic plasma with respect to transverse perturbations exists even when there is no external magnetic field. Small perturbations $\vec{H}_1 = \vec{H}_0 \exp(i\vec{k}_{||}\vec{x})$ of plasma magnetic field produce in the plasma the current

$$\vec{j} = \sum_{\alpha} 2\pi \frac{n_{\alpha} e}{mc} \frac{i\vec{k}_{||} \times \vec{H}_1}{k^2} \int \left(\frac{\partial f_0}{\partial v_{\perp}^2} - \frac{\partial f_0}{\partial v_{||}^2} \right) v_{\perp}^2 dv_{\perp} dv_{||}$$

$f_0 = f_0(v_{\perp}^2, v_{||}^2)$ is the unperturbed velocity distribution in the plasma. The quantity characterizes the anisotropy of the system. By applying the relation

$$A = 2\pi \int \left(\frac{\partial f_0}{\partial v_{\perp}^2} - \frac{\partial f_0}{\partial v_{||}^2} \right) v_{\perp}^2 dv_{\perp} dv_{||} \quad (1)$$

S/057/62/032/005/019/022
B104/B102

The instability of an anisotropic...

$\text{curl} \vec{H} = \frac{4\pi}{c} \vec{j}$ it is found that perturbations with k equal to

$k_0 = \frac{1}{c} \left(\sum_{e,i} A \omega_0^2 \right)^{1/2}$ are stationary. For $k < k_0$ the perturbations are unstable.

For a Maxwellian distribution

$$f_0 = \frac{m^{3/2}}{2\pi T_{\perp} (2\pi T_{\parallel})^{1/2}} e^{-\frac{mv_{\perp}^2}{2T_{\perp}} - \frac{mv_{\parallel}^2}{2T_{\parallel}}} \quad (3)$$

with anisotropic temperature distribution there occurs an instability at

$T_{\perp} > T_{\parallel}$ where $k_0 = \frac{1}{c} \left(\sum_{e,i} \frac{T_{\perp} - T_{\parallel}}{T_{\parallel}} \omega_0^2 \right)^{1/2}$. From the dispersion equation

$$c^2 k^2 - \omega^2 - \sum_{e,i} A \omega_0^2 = \sum_{e,i} 2\pi \omega_0^2 \left\{ \frac{\omega}{k} \int \frac{\frac{\partial f_0}{\partial v_{\parallel}}}{\frac{\omega \pm \omega_H}{k} - v_{\parallel}} v_{\perp}^2 dv_{\perp} dv_{\parallel} \mp \frac{\omega_H}{k} \int \frac{\frac{\partial f_0}{\partial v_{\perp}^2} - \frac{\partial f_0}{\partial v_{\parallel}^2}}{\frac{\omega \pm \omega_H}{k} - v_{\parallel}} v_{\perp}^3 dv_{\perp} dv_{\parallel} \right\} \quad (4)$$

Softening hides. I. P. Stefanovich. Russ. 54,205,
Nov. 30, 1938. The hides are treated with pepsin in an
acid medium and in the presence of NaCl.

ASB-SLA METALLURGICAL LITERATURE CLASSIFICATION

Proteolytic enzymes of oats and their effect on fur.
I. P. Stefanovich. *Hukhomyr* 3, 7:11 9, 1968. To
improve the quality of fur, the best treatment has been to
keep the raw hides for 4-5 days at 32° in a vat of oat
flour (15%) and NaCl (1.5%). The proteolytic enzyme
responsible is very similar to papain. H. Cohen

Improvement of methods in the dressing of furs by pickling. I. P. Stefanovich. *Lekaya Prom.* 2, No. 7, S. 15-18(1942).—The tanning process can be combined with the softening process. Changing the alkyl of the Cr liquor added to the softening bath has little effect on the change in the shrinkage temp. of the tanned skins. Addn. of Cr liquor to the pickling bath under the same conditions results in a considerably lower shrinkage temp.; this indicates the absence of any tanning effect of the bath. On the basis of the exptl. data obtained a method for the dressing of Persian lamb has been developed. W. R. Henn

TITLE : The Effect of Yeast Containing Feeds upon
Growth and Development of Chicks.
ORIG. PUB. : Izv. AN LatvSSR, 1957, No 12, 89-95
ABSTRACT : Two methods of adding yeast to feed were compared: the usual method and a method of intensive aeration by a compressor with ammonia sulfate, as well as the effects of two kinds of yeasts: "fodder" and "baker's" yeast. In the four experimental groups which consisted of 11 chicks each, the chicks were given feed containing yeast from the age of 5 months; the 5th group was the control group (without yeast-containing feeds). The weight gain of chicks

ABSTRACT : that were fed feed to which yeast had been added by the usual method, amounted to 15 percent, but when the aeration method was employed, it amounted to 33.3-36.8 percent and "fodder" yeast produced better results in any case. The chicks consumed more feed as compared to controls, but in terms of weight gain units yeast-containing feeds are more economical. The content of riboflavin increased in the liver and kidneys of the chicks, especially when aeration was used. In these same organs changes

V Influence of pressure on blast travel in blast furnaces.
M. A. Stefanovich (Mining-Met. Inst., Magnitogorsk).
Stal' 15, 398-407 (1955).—The pressure drop h of gas stream passing through a blast furnace can be given as $h = l \gamma W^2 P / TH / 2 g d^5 T_0 P$ where l is coefficient of resistance, γ norm. sp. gr. of the gas, P and P_0 actual and standard pressures, W gas velocity, T and T_0 actual and standard gas temp. in K., H height of the charge in m., $g = 9.81$, d linear dimension of the gas stream, ϵ porosity of the charge. The development of this formula is given, and the terms used fully described. The effect of top pressure P_0 on pressure at the tuyère level P_t can be expressed as $P_t = \sqrt{P_0^2 - P_0^2} (Q_0/Q_0)^m + P_0^2$ where P_t and P_0 are pressures at the tuyère and top levels in conventional operations, Q_0 and Q_0 blast vol. under normal and high top pressures in cubic m., and m experimentally detd. coeff. With an increased P_0 , the difference in pressures in the furnace decreases, while the pressure itself grows, though slower than the P_0 . When the latter is changed from 0.12 to 2.0 atm., the pressure difference drops from 1.23 to 0.64 atm., or 31.4% of the pressure

increase, but blast pressure grows from 1.35 to 2.04 atm. or 68.0% of the P_0 . An increased top pressure moved the CO_2 content towards the center lowering it by 0.2-0.4% at the walls, raised gas temp. by 71.8°, greatly lowered its velocity at the periphery and slightly in the center but did not affect much the difference in pressures across the furnace. Cause and effect of channeling is presented. The slope of charge layers is increased by the supporting effect of gas, and increased pressure intensifies the difference in slope of coke and ore layers. The velocity of gases travelling through the charge drops 7.5-9.2 times above it causing the size of particles carried by them to decrease 58-86 times. Larger particles are cushioned by gases and tend to slide down the slope towards the center of the furnace. When with the normal top pressure gases can float 8.4-42.9-mm. particles, raising it to 0.7 atm. reduces their size to 5.1-27 mm. so that coarser particles can remain at the periphery of the furnace lowering permeability to the blast. With higher top pressures, an increased vol. at the same difference in pressure will be obtained in the upper levels of the furnace. When the top pressure is raised from 0.12 to 0.5 atm., a vol. increase at the tuyère level, in the middle of the furnace, and just below the top of the charge possible for each 0.1-atm. pressure increase will be, resp., 1.8, 2.9, and 4.42%. The same pressure drop between these levels being retained. How much blast vol. can be increased is defined by the direct and indirect effect of the increased pressure in the crit. zone of the furnace which lies in the stack of furnaces working with fine burden, low coke consumption, and low slag vol. and in the zone of slag formation of furnaces operating on the prepared burden and a high slag ratio.

PHASE I BOOK EXPLOITATION

SOV/1247

Dostizheniya domenshchikov Magnitogorskogo metallurgicheskogo kombinata
(Achievements of Blast Furnace Operators of the Magnitogorsk
Metallurgical Combine) Moscow, Metallurgizdat, 1957. 279 p.
3,000 copies printed.

Ed.: Bannykh, A.I., Professor; Ed of Publishing House: Yablonskaya,
L.V.; Tech. Ed.: Attopovich, M.K.

PURPOSE: This book is intended for engineers, foundry foremen, and
personnel in research institutes. It may also be useful to students
and others interested in foundry practice.

COVERAGE: This book deals with achievements of the foundries of the
Magnitogorsk Metallurgical Combine. The processes of preparing
the charge, melting and pouring are described. Improvements in
foundry methods and the theory behind these improvements are presented
with numerous graphs and illustrations. The book is the combined
effort of the following authors: Foreword: Bannykh, A.M. (editor);
Introduction, parts 1 and 2: Bannykh, A.M.; part 3 by

TITLE: Fundamental Features and Relationships of the Movement of Gases in the Blast Furnace (Osnovnyye kharakteristiki i zavisimosti dvizheniya gazov v domennoy pechi)

PERIODICAL: V sb.: Issled. domennogo protsessa. Moscow, AN SSSR, 1957, pp 111-137

ABSTRACT: Adopted as the fundamental parameters of the current of gas moving through a layer are: the mean speed of the movement of the gas in the intragranular voids and the reduced dimensions of the voids, both calculated on the basis of the determination of the speed of the movement of the gas in an empty shaft, the porosity, and the grain size of the layer of the furnace charge. Experimental data, obtained for various furnace charges, indicate that with an identical distribution of the charge throughout the cross section of the blast furnace the gas current travels more uniformly when the gas flow is turbulent. The relationships of the resistance of the layer of the furnace charge to the flow of the gases with various factors,

Card 1/2

SOV/137-58-8-16452

Fundamental Features and Relationships of the Movement of Gases (cont.)

namely, the grain size of the layer, the flow regime of the gas flow, and the temperatures, pressures, and composition of the gas, are clarified. The pressure losses in the layer of the furnace charge decrease with the blowing out of the fine particles and the formation of passages in the charge. Experiments on the establishment of critical speeds which cause the formation of the passages indicate that this phenomenon takes place during the normal operation of the blast furnace. The loss of pressure in the furnace charge is also affected by the method of the loading of the charge (mixed or separate loading of the ore and coke) and the irregularity in the distribution of the materials over the cross section of the charge hole. Upon the changing over from the separate to the joint charging of the ore and coke either an increase or a decrease in the loss of pressure can occur depending upon the state of the surface and the size of the lumps of the material, and likewise the flow regime of the gas. An uneven distribution of the materials over the cross section of the charge hole decreases the losses of pressure and makes it possible to intensify the operation of the blast furnace. However, an increase in the unevenness of the distribution of the materials over and above an optimum causes a transitional flow of gas in place of the turbulent one. This results in an uneven distribution of the gas current, a deterioration of the utilization of the thermal and chemical energy of the gases, and an increase in the relative consumption of coke for the smelting of the iron.

TITLE: Conditions for the Production of Low Sulfur Pig Iron (Usloviya polucheniya chuguna s nizkim sodержaniyem sery)

PERIODICAL: Sb.: nauchn. tr. Magnitogorskiy gorno-metallurg. in-t, 1957, Nr 11, pp 5-33

ABSTRACT: The S content in the pig iron (PI) smelted in the furnaces of the Magnitogorskiy Combine decreased from 0.045 - 0.051 percent in 1951 to 0.036 percent in 1954. This decrease in the S content is attributable to the following factors: an 11-16 percent reduction in the amount of S introduced with the charge (this was accomplished by reducing the coke consumption, removing the Mn-ore from the charge, and reducing the amount of S in crushed ore), and an increase in the coefficient of distribution of S between the PI and the slag (accomplished by increasing the alkalinity of the slag and its temperature and by reducing its amount). Statistical processing of the production data, as well as a study of the peculiarities in the behavior of S under laboratory conditions (distribution of S between the PI and the slag, and the

Card 1/2

137-1958-3-4747

Conditions for the Production of Low Sulfur Pig Iron

viscosity of slag), have demonstrated that PI with a low [S] may be obtained by means of increasing the alkalinity of the slag, and by raising its temperature. In order to reduce the [S] content in open-hearth, low-manganese (approx. 0.2 percent Mn) PI, to 0.03 - 0.035 percent, it is recommended that the $\text{CaO}:\text{SiO}_2$ ratio in the slag be increased to 1.12 - 1.13, and that the MgO content be raised to 8-9 percent. It is pointed out that the process of desulfurization of PI is facilitated if the $\text{CaO}:\text{SiO}_2$ ratio in the fluxed sinter is constant.

Stefanovich, Mikhail Aleksandrovich

Analiz khoda domennogo protsessa (Analysis of the Run of a Blast-Furnace Process)
Sverdlovsk, Metallurgizdat, Sverdlovskoye otd-niye, 1960. 286 p. Errata slip
inserted. 2,200 copies printed.

Reviewer: V.G. Manchinskiy; Ed.: S.K. Trekalo; Ed. of Publishing House: M.L.
Kryzhova; Tech. Ed.: R.M. Matlyuk.

PURPOSE: This book is intended for production engineers, scientific workers, and
students in schools of higher education.

COVERAGE: The book presents results of an investigation carried out by the author
at the Magnitogorskiy metallurgicheskiy kombinat (Magnitogorsk Metallurgical
Combine) during the period 1946-56. The book includes a discussion of phe-
nomena indicative of the information on the smelting process, the interrelation-
ship between the passages of charge and gases and the heat-exchange process, and
the reduction of iron and slag formation. On the basis of data obtained from
the investigation the author outlines principles for the efficient preparation
